Line Balancing Study - Assembly Line 2

Manufacturing Knowledge Hub | Process Engineering

Owner: Carlos Ibarra | Last updated: October 30, 2026

Time study and line balancing analysis identifying the bottleneck station and proposed cycle time redistribution.

Key Points

- Station 4 cycle time exceeded takt time by 8 seconds, creating a recurring bottleneck.
- Redistributing one sub-assembly step to Station 3 reduced the bottleneck to within 2 seconds of takt.
- Projected throughput improvement is approximately 6% without added headcount.
- Recommendation is scheduled for pilot validation next production cycle.
